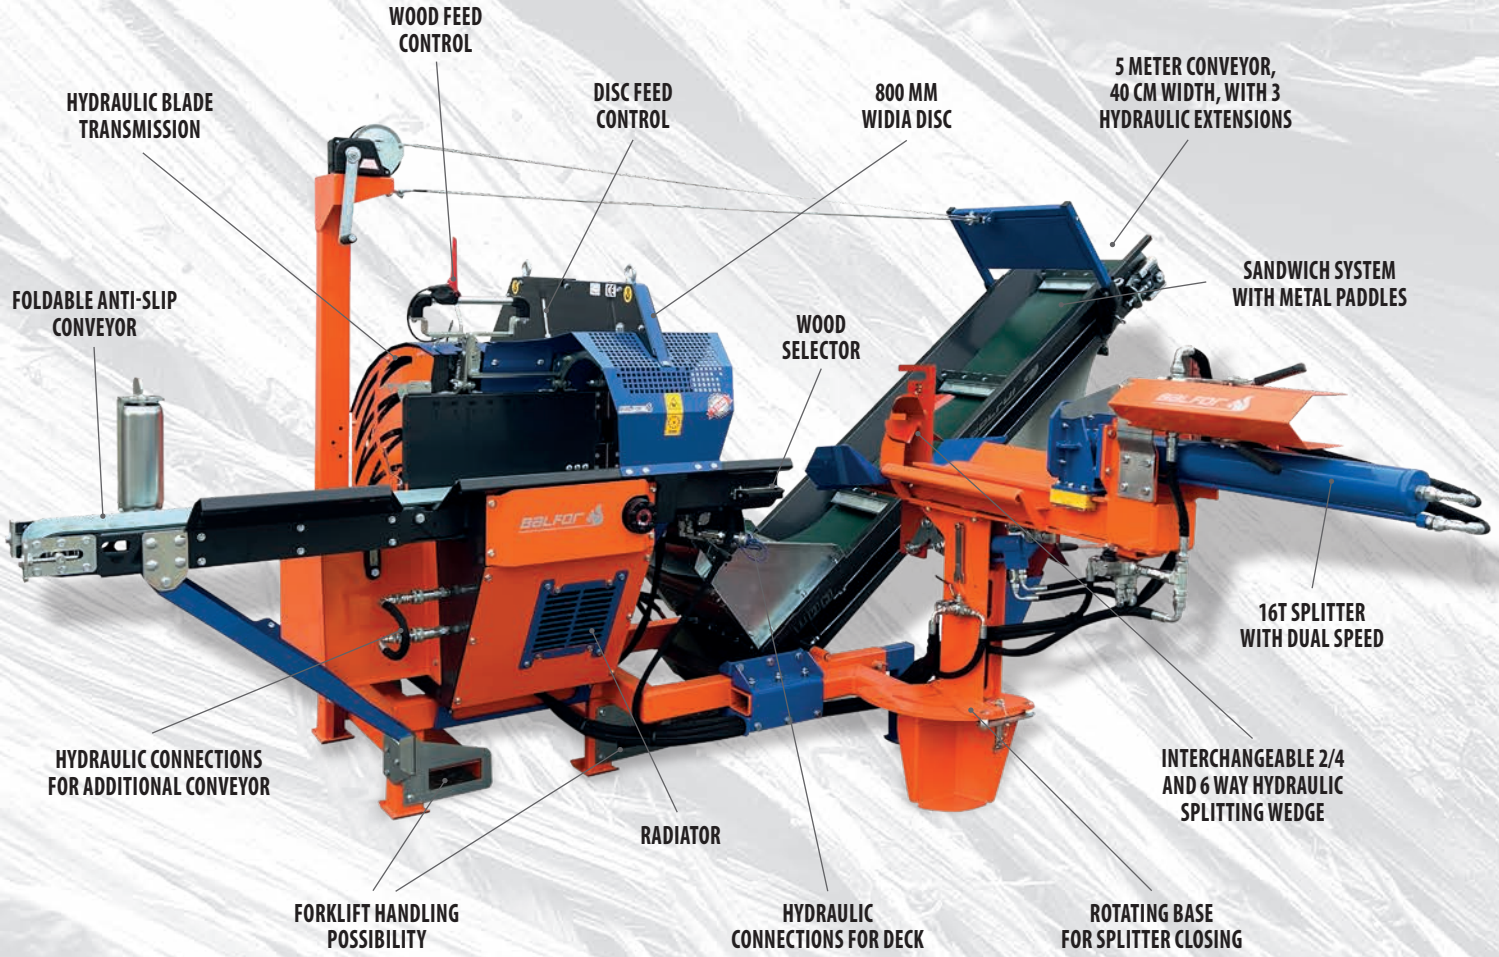
NINJA 800 EXPERT



NINJA 800 Expert is the latest addition to the BALFOR range, a true mobile plant for firewood production. Thanks to its great versatility, **NINJA 800 Expert** can work on all types of wood, branches and logs. By opening or closing the log support positioned after the cutting blade, the operator decides whether the wood should fall directly onto the conveyor or be taken again to be split. The log splitter develops 16 tons of power and is equipped with a robust hydraulic wedge supplied with two interchangeable splitting wedges. The wide conveyor with three hydraulic extensions allows fast and effective evacuation of all the wood processed by the machine. Log feeding takes place via conveyor belt and the advancement of the 800 mm WIDIA blade is fully hydraulic. The operator therefore only needs to operate the levers as in all firewood processing plants. Being fully hydraulic, maintenance is minimal and, to avoid overheating, an oversized tank combined with a large oil radiator has been installed. **NINJA 800 Expert** is already equipped with connections for chain conveyor systems in order to automate the process as much as possible.
